# ✉ MESSAGES

Critical information can be efficiently transmitted to employees' smartphones, reducing the reliance on lengthy phone calls or emails that may go unread in real-time. Authorized personnel with specific access rights can compose messages.

Message senders can define the recipients, groups, or users, along with setting time constraints to prevent overwhelming employees with non-essential information.

Priority messages

Important messages that should not be overlooked can be defined as priority messages. Voice playback can be activated when such a message is received. This allows the care staff to listen to the message hands-free.
